

## 一、设计题目:

电子万年历

## 二、设计原理:

单片机应用系统由硬件系统和软件系统两部分组成。硬件系统是指单片机以及扩展的存储器、I/O 接口、外围扩展的功能芯片以及接口电路。软件系统包括监控程序和各种应用程序。

在单片机应用系统中,单片机是整个系统的核心,对整个系统的信息输入、处理、信息输出进行控制。与单片机配套的有相应的复位电路、时钟电路以及扩展的存储器和 I/O 接口,使单片机应用系统能够运行。

本设计利用 2kHz 的中断每 0.5 秒钟产生一个中断来产生秒的计数,进而实现时钟部分的功能。在每次时间改变时调用 LCD 显示子程序,来实现时间的显示。用实验板上自带的三个按键来实现报时功能及时间调整功能,并利用置不同的标志位来实现年月日时分秒的调整。利用 A2000 自动播放进行时间的播报。

## 三、设计要求:

- 1、key1——按一下播放年并进入年的调整状态,再按一下下播放月并进入月的调整状态,以此类推到日、时、分、秒;
- 2、key2——年、月、日、时、分、秒的增加;
- 3、key3——年、月、日、时、分、秒的减少;

#### 4、复位键——按下之后复位

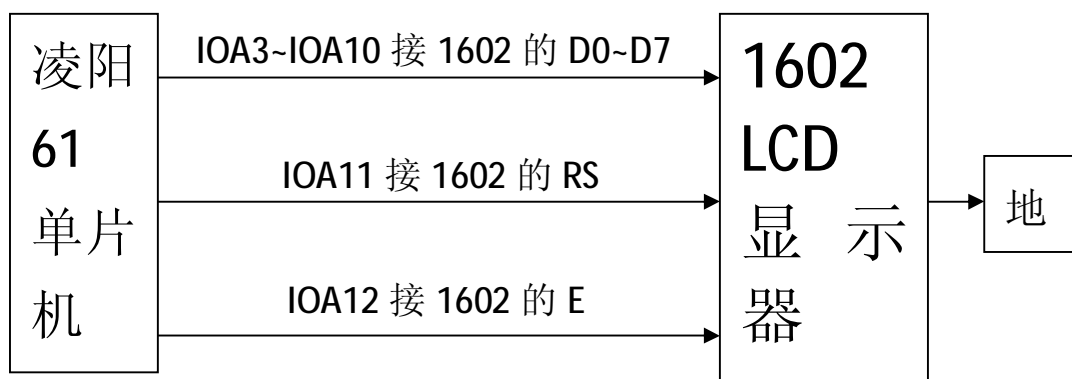

实现功能:

- 1、数字钟功能
- 3、报时功能、闹表功能、定时提醒功能

### 四、设计材料

这个设计的材料有: 1602LCD 显示器、18B20、凌阳 61 单片机、排线、排针、连接线、电池等

### 五、设计流程图

### 六、设计源程序

```
/**
//项目: e_clock
//实现功能: 1、数字钟功能
//           2、测温功能、提醒功能
//           3、报时功能、闹表功能、定时提醒功能

//作者: 郭新新
//cpu 时钟调整: P_SystemClock 重新赋值, 比如语句[P_SystemClock]=0x31(00110001),
//则将系统始终(PLL)更换为 20.480MHz,CPU 始终选择为 Fosc/2, 即 10.240MHz, 约为 0.098us,
//那么如果要要实现 1us 的延时, 只要实现将延时程序中语句总的执行周期约为 10 个 CPU
//周期即可
**/
