QFN Socket Upgrade to K

QFN sockets are now available with new features to offer improved performance for a wider range of feature sizes. A new offset contact tip has been introduced to optimize the point of connection on the device pads. The "T" in the socket number becomes a "K". The socket footprint remains the same for both K and T styles.

Improvements include:

- 1) New offset contact in K type touches pads closer to outside edge of package and provides improved contact scrub. Contact tip is moved an additional .004" [.10mm] away from center for K versus older T type.
- 2) Plastic nest molded from new tooling made to tighter tolerances for K type. Nest size is reduced and contact registration is improved.
- 3) Center pin lowered to increase contact travel and force for K type.

Plastronics continually reviews product function and provides improvements to maintain the highest level of customer satisfaction. Your local sales representative or the factory can answer any additional questions.
